Optimization

NSGA-II Genetic Algorithm
OPF benchmark approach

Results

Conclusions

- ▶ Variable renewable energy like wind and solar is becoming increasingly prevalent in the electrical grid.
- ▶ The presence of these sources leads to unwanted effects in the grid such as overvoltages and voltage imbalances.
- ▶ Historic solutions are not well equipped to deal with these effects and especially the fast response times required.
- ▶ New power electronics based solutions, such as the unified power quality converter (UPQC), are investigated to solve this problem.

Newton-Raphson method

Optimization

NSGA-II Genetic Algorithm
OPF benchmark approach

Results

Conclusions

- ▶ To analyze voltage spread of distribution grid with high penetration of solar.
- ▶ To develop a dynamic model of the UPQC, including all required controllers.
- ▶ To develop an equivalent static model of the UPQC and validate its behaviour with the dynamic model.
- ▶ To propose design methodology for the converter sizing making use of the developed tools.
- ▶ To show behaviour of the converter over sample days using different design criteria.

6. Conclusions

Converters are prone to be saturated during short-circuits (I_{max} is reached).

Table 1: Possible operating states of the converters in grid-following mode.

| Converter State | PQ | PV |
|-----------------|------------------|------------------|
| USS | P, Q | P, V |
| PSS | Q, I_{max} | V, I_{max} |
| FSS | $P = 0, I_{max}$ | $P = 0, I_{max}$ |
| DIS | $P = 0, Q = 0$ | $P = 0, Q = 0$ |

Traditional power flow:

$$\begin{pmatrix} \Delta \mathbf{f}_P \\ \Delta \mathbf{f}_Q \end{pmatrix} = - \begin{pmatrix} \frac{d\mathbf{f}_P}{d\theta} & \frac{d\mathbf{f}_P}{d\nu} \\ \frac{d\mathbf{f}_Q}{d\theta} & \frac{d\mathbf{f}_Q}{d\nu} \end{pmatrix} \begin{pmatrix} \Delta \theta \\ \Delta \nu \end{pmatrix}. \quad (1)$$

Extended Newton-Raphson considering current saturation:

$$\begin{pmatrix} \Delta \mathbf{f}_P \\ \Delta \mathbf{f}_Q \\ \Delta \mathbf{f}_{I^2} \end{pmatrix} = - \begin{pmatrix} \frac{d\mathbf{f}_P}{d\theta} & \frac{d\mathbf{f}_P}{d\nu} \\ \frac{d\mathbf{f}_Q}{d\theta} & \frac{d\mathbf{f}_Q}{d\nu} \\ \frac{d\mathbf{f}_{I^2}}{d\theta} & \frac{d\mathbf{f}_{I^2}}{d\nu} \end{pmatrix} \begin{pmatrix} \Delta \theta \\ \Delta \nu \end{pmatrix}, \quad (2)$$

where the residuals are:

$$\begin{cases} \Delta \mathbf{f}_P = -\mathbf{P}_{\text{set}} + \Re([\mathbf{V}]\mathbf{Y}^*\mathbf{V}^*), \\ \Delta \mathbf{f}_Q = -\mathbf{Q}_{\text{set}} + \Im([\mathbf{V}]\mathbf{Y}^*\mathbf{V}^*), \\ \Delta \mathbf{f}_{I^2} = \mathbf{I}_c \mathbf{I}_c^* = -\mathbf{I}_{c,\max}^2 + (\mathbf{Y}\mathbf{V} - [\mathbf{V}^*]^{-1}\mathbf{S}^* - \mathbf{I}_l) \cdot (\mathbf{Y}\mathbf{V} - [\mathbf{V}^*]^{-1}\mathbf{S}^* - \mathbf{I}_l)^*. \end{cases} \quad (3)$$

New categories of buses emerge:

Table 2: Traditional types of buses and mapping to new buses depending on the converter state.

| Converter State | PQ Control | PV Control |
|-----------------|------------|------------|
| USS | PQ | PV |
| PSS | QI | VI |
| FSS | PI | PI |
| DIS | PQ | PQ |

Figure 1: Approximate location of the three converters.

Table 3: Power flow results for the converters under normal conditions.

| VSC | State | ν | θ ($^{\circ}$) | $ I $ | P | Q | $ S $ |
|------|-------|--------|-------------------------|--------|---------|--------|--------|
| vsc1 | USS | 1.0073 | -40.7924 | 5.8017 | -5.0000 | 3.0260 | 5.8443 |
| vsc2 | USS | 1.0050 | -63.9565 | 1.3882 | -1.0000 | 0.9731 | 1.3953 |
| vsc3 | USS | 1.0200 | -48.6301 | 6.0529 | 6.0000 | 1.4580 | 6.1746 |

Table 4: Short-circuit results for the converters with $\underline{Z}_f = 0.002j$.

| VSC | State | ν | θ ($^{\circ}$) | $ I $ | P | Q | $ S $ |
|------|-------|--------|-------------------------|--------|---------|--------|--------|
| vsc1 | FSS | 0.0633 | -14.1576 | 7.0000 | 0.0000 | 0.4431 | 0.4431 |
| vsc2 | USS | 0.9997 | -63.3836 | 1.3958 | -1.0000 | 0.9732 | 1.3954 |
| vsc3 | USS | 0.9997 | -46.1701 | 6.1764 | 6.0000 | 1.4582 | 6.1746 |

Table 5: Short-circuit results for the converters with $\underline{Z}_f = 0.05j$.

| VSC | State | ν | θ ($^{\circ}$) | $ I $ | P | Q | $ S $ |
|------|-------|--------|-------------------------|--------|---------|--------|--------|
| vsc1 | PSS | 0.6423 | -34.1962 | 7.0000 | -3.1009 | 3.2557 | 4.4962 |
| vsc2 | USS | 1.0050 | -63.9565 | 1.3882 | -1.0000 | 0.9696 | 1.3928 |
| vsc3 | USS | 1.0200 | -48.6301 | 6.0529 | 6.0000 | 1.4453 | 6.1716 |

(a) VSC1 power injections.

(b) Fault voltage.

Figure 2: Dynamic simulation with PSS/E for a severe fault with $\underline{Z}_f = j0.002$ pu.

Steady-state calculations:

Table 6: Steady-state short-circuit results with the proposed method and PSS/E.

| $\begin{matrix} I_{sc} \\ \hline Z_f \end{matrix}$ | Proposed method | PSS/E VSCs as generators | PSS/E VSCs as FACTS |
|----------------------------------------------------|-----------------|--------------------------|---------------------|
| $j0.05$ | 12.75 | 13.40 | 12.17 |
| $j0.002$ | 31.40 | 32.57 | 25.91 |

PSS/E dynamic simulation:

Table 7: Comparison of efficiency with PSS/E dynamic simulation.

| t_{sim} after fault (s) | Calculation time (s) | Error $ u_{sample} - u_{cal} $ (pu) |
|---------------------------|----------------------|-------------------------------------|
| 0.3 | 1.43 | 42×10^{-3} |
| 1 | 3.52 | 19.8×10^{-3} |
| 2 | 6.81 | 6.5×10^{-3} |
| 3 | 10.07 | 1.6×10^{-3} |
| 4 | 13.14 | $< 0.1 \times 10^{-3}$ |
| Proposed method | 0.085 | 6.17×10^{-11} |
